Subject: Biweekly report (December 3, 2021 - December 16, 2021)

Please find attached preliminary daily estimates of passage, 90% confidence intervals, and fork length ranges of unmarked juvenile salmonids sampled at Red Bluff Diversion Dam for the period December 3, 2021 through December 16, 2021. Race designation was assigned using length-at-date criteria.

Mean cumulative weekly passage of winter Chinook thru December 16 (week 50) for the last 18 years of passage data is 95.5% with one standard deviation measuring 3.8%.

NOTE: Bi-weekly reports produced after July 1, 2021 will be revised at a later date due to ongoing trap efficiency model analyses. Due to changes in river channel morphology in recent years at the Red Bluff Diversion Dam sample site along with sampling predominantly smaller 5' rotary traps, trap efficiency estimators and models are being reviewed at this time and passage estimates are subject to change in-season and/or post-season. This report contains passage estimates using a trap efficiency model that includes data from mark-recapture experiments from 2018-2021 and is currently the best available data to report preliminary real-time passage estimates with. Feel free to contact me if there are any questions.

This report also contains graphical displays of salmonid passage dating back to 2014 for comparison.

Please note that data contained in these reports is subject to revision as this data is preliminary and undergoing QA/QC procedures.

If you have any questions, please feel free to contact me at (530) 527-3043 ext 243.

Table 1.— Preliminary estimates of passage by brood-year (BY) and run for unmarked juvenile Chinook salmon and steelhead trout captured by rotary-screw traps at Red Bluff Diversion Dam (RK391), Sacramento River, CA, for the dates listed below. Results include estimated passage, peak river discharge volume, water temperature, turbidity, and fork length (mm) range in parentheses. A dash (-) indicates that sampling was not conducted on that date.

¹ Peak daily discharge values do not account for diversions at RBDD and only represent peak flows registered at the Bend Bridge Gauging station (<http://cdec2.water.ca.gov/cgi-progs/queryFx?bnd>).

² Biweekly totals may be greater than the sum of the daily estimates presented in this table if sampling was not conducted on each day of the biweekly period. A dash (-) denotes those dates. To estimate daily passage for days that were not sampled, we impute missed sample days with the weekly mean value of days sampled within the week.

Juvenile Winter Chinook Salmon Estimated Passage
